Subject: DC3000 testing

Michael,

I wanted to follow up with you regarding an evaluation conducted in our Westlake facility on May 16th 2006.

We initially did our evaluations on our DC3000 Velocity Clear coat using the Farecla "Total" compound, later on 8150, 8180 and 8450 using also the Farecla Total Compound.

We evaluated polishing properties of the compound with all products and in particular DC3000 in both bake and air dry mode (same day and 24 hrs). We were very pleased with the initial results. The "Total" polishing compound effectively removed 1500 and 2000 scratches quickly and thoroughly leaving a very clear and swirl free finish. Even after wipe down they remained excellent.

Keeping in mind the work conducted was under controlled conditions, we were impressed with the results. We continue further evaluations using the "Total" compound with DC3000 and other PPG clear coats.

Sincerely,

Mark Rapson
